

Patient Safety, Overuse, Waste & Missed Opportunities for Right Care: Typically *Overlooked* Are These...

← Often published studies—even of best repute—are of *uncertain* reliability and clinical usefulness

This can hurt patients + costs us all...

Typically, **clinicians**

1. Are not aware of this problem.
2. Can't tell good studies from bad.
3. Want to *Diagnose + Do*.
4. Fail in communicating key information that patients need to make informed decisions.

Typically, **patients** expect something done and trust their doctors.

Patient Safety, Overuse, Waste & Missed Opportunities for Right Care:
Cannot be Resolved Without
Addressing These *Largely Ignored* Problems...

Many of these problems stem from *inadequate training* of health care professionals in evidence interpretation and typical omissions of information patients most need. Gaining new skills is very doable.

WE CAN HELP.

We have decades of experience restructuring health care systems to improve clinical quality and in training health care professionals and groups (e.g., P&T committees) in evidence-based clinical improvement techniques and patient communications. We have helped patients, payers and providers, governments and universities, and more.
